outputs. Small successful subsets can produce high quality means, while early failures can reduce costs; the aggregation differences described above also apply to this figure.

General-capability comparison. Fig. 9 uses the displayed integer Artificial Analysis Intelligence Index scores from version 4.3.2, accessed on September 27, 2026, for the reasoning configurations listed on the public model pages [Artificial Analysis, 2026]. The image quality pass rate is the *All Criteria* count divided by 50. Spearman correlation between this rate and the index is $\rho = 0.65$ across 11 models. The public DeepSeek-V4-Pro score refers to checkpoint 0813, whose correspondence to our evaluated checkpoint is unverified; excluding it gives $\rho = 0.63$. Public evaluation settings may differ from those used in our harness, so this analysis characterizes an association rather than isolating the effects of model capability.

Numerical color scales. In Tables 2 and 4, orange and blue indicate values above and below DeepSeek-V4.1-Flash, respectively. Colors encode numerical differences, not a uniform preference across metrics. Relative-change intensity is $\sqrt{\min(|x/b - 1|, 1)}$, where x is a reported value and b is its baseline. Because DeepSeek has zero successful videos, video success-rate intensity instead uses $\sqrt{|x - b|/100}$, with x and b expressed as percentages. Video *Time/Success* uses Kimi-K2.6 as its baseline.

Quality-table highlighting. In Tables 3 and 5, blue and orange indicate higher and lower GPT results relative to GPT-5.6-Luna for images and GPT-5.6-Sol for videos. Color intensity follows the relative-change rule above. DeepSeek and Kimi use a separate gray scale because their quality results cover fewer successful tasks; darker gray denotes larger values within each reference column. Bold identifies the best GPT values, excluding the descriptive *Evaluated* column. Quality-threshold counts remain comparable as counts over the full task set, while means describe different successful subsets.

6.4 Prompts for the Qualitative Image Comparisons

The five prompts below follow the row order in Fig. 6. Chinese prompts and display text are translated into English for presentation; evaluation used the original wording. Prompt content is presented separately from the evaluation protocol and does not imply that a generated output satisfies every requested property.

Fox Painter on a Teacup.

A flat 2D cartoon fox painter stands on the rim of a realistic white porcelain teacup. Output a 1536×864 landscape PNG. Place the teacup slightly left of center on a wooden table, with natural highlights on its glaze, its handle on the right, and dark tea visible inside. The fox holds a paintbrush in one paw and a small palette in the other, painting a short blue arc on the handle. Both feet must rest on the rim nearest the viewer; the fox must not float or stand in the tea.

Render the fox with solid orange color blocks, clear black outlines, and a white muzzle, creating a distinct contrast with the realistic ceramic and wood grain. Use soft window light from the left, a light gray background, and negative space on the right. The brush tip must touch the handle, and the character must not be larger than the entire teacup. Do not add text, extra characters, or a frame around the entire scene.

Mountain Teahouse Concept.

Create a 2048×1152 landscape architectural survey board for a fictional timber teahouse, titled "Mountain Teahouse" and "MOUNTAIN TEAHOUSE", with a small "CONCEPT STUDY" label.

Use a wide main panel on the left and a narrower column of two panels on the right. The left panel shows a three-quarter axonometric teahouse raised on stone piers on a hillside: one curved gable roof, an open front veranda, four evenly spaced front columns, sliding rear screens and a short stair descending toward the foreground. Add a small tree behind the building without hiding the roof.

The upper-right panel, "Front elevation", repeats the four columns, roof curve and central stair. The lower-right panel, "Section", cuts across the veranda and enclosed rear room, revealing roof rafters and stone supports. A bottom strip contains three enlarged details labeled "Roof joint", "Column
